Two Components of Using Forms

The web page form

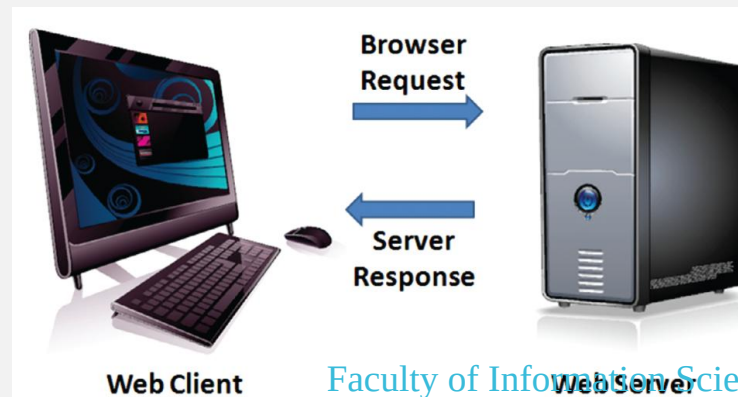

An HTML element that contains and organizes form controls such as text boxes, check boxes, and buttons that can **accept information** from **website visitors**.

The server-side processing

Server-side processing works with the form data and sends e-mail, writes to a text file, updates a database, or performs some other type of processing on the server.

Server-Side Processing

- Your web browser requests web pages and their related files from a web server.
- The web server locates the files and sends them to your web browser.
- The web browser then renders the returned files and displays the requested web pages for you to use.
- One of many technologies in which a server-side script is embedded within a web page document saved with a file extension such as:
 - .php (PHP)
 - .cfm (Adobe ColdFusion)
 - .jsp (Sun JavaServer Pages)
 - .aspx (ASP.Net).

Sample Form HTML

```
<html>
<head><title>Form Example</title></head>
<body>
<form> <h1>Join Our Newsletter</h1>
E-mail: <input type="text" name="email" id="email">
<br><br>
<input type="submit" value="Sign Me Up!">
<input type="reset">
</form>
</body>
</html>
```

A screenshot of a web browser window titled "Form Example". The address bar shows a local file path: "file:///C:/Users/Administrator/Desktop/...". The page content displays the rendered HTML form: a large heading "Join Our Newsletter", followed by the text "E-mail:" and a text input field. Below the input field are two buttons: "Sign Me Up!" and "Reset".

Form Example

file:///C:/Users/Administrator/Desktop/...

Join Our Newsletter

E-mail:

HTML Using Forms

<form>

- Contains the *form elements* on a web page
- “Container tag”

<input>

- Accepts text information including *text boxes*, *radio buttons*, *check boxes*, and *buttons*
- “Stand alone tag”

<textarea>

- Configures a *scrolling text box*
- “Container tag”

<select>

- Configures a *select box* (drop down list)
- “Container tag”

<option>

- Configures an *option* in the select box
- “Container tag”

The Form Element `<form>`

1. action

- ✓ Specifies the server-side program or page or script that will process the submitted form data

E.g. `<form action="/action_page.php">`

2. method:

- ✓ specifies the HTTP method to be used when submitting the form data.

- `get` – default value, form data passed in URL
- `post` – more secure, form data passed in HTTP Entity Body

`<form action="/action_page.php" method="get">`

`/action_page.php?fname=Ma&lname=Phyu`

`<form action="/action_page.php" method="post">`

`/action_page.php`

The Form Element `<form>`

3. name

- ✓ Describes the name of the form element so the form-data can be referenced after submitting.
- ✓ Used in the HTTP request sent by browser to the server as a variable name.

E.g. `<form name="name">`

4. id

- ✓ Identifies the form.
- ✓ It is just an identification, nothing to do with the data within the element and attached in writing/ using in Javascript and CSS.

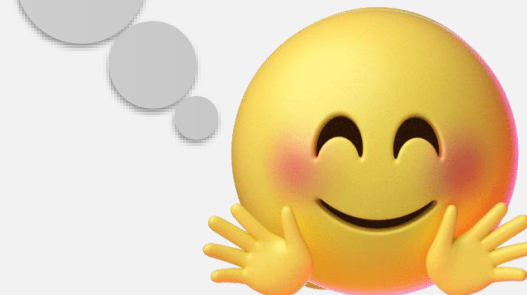

E.g. `<form id="form1">`

Quiz

Which are the two possible values the method attribute in the <form> tag can have?

- ✓ get and action
- ✓ get and post
- ✓ name and action

Summary

Lecture 6.1: Use of forms on Web Pages

- ✓ HTML Form
- ✓ Types of Form
- ✓ Two Components of Using Forms
- ✓ Sample Form HTML
- ✓ HTML Using Form
- ✓ The `<form>` element
